PUBLISHING DATA

Originating Agency: None

Publishing House: Publishing House of Hydrometeorology

Date: 1953 No. pp.: 544 No. of copies: 8,000

Editorial Staff: R. E. Soloveychik, editor, Kand. Phys. and Math Sci.  
PURPOSE: The book is written for students of hydrometeorological insti-  
tutes and state universities, but can be used by designers of instru-  
ments and other specialists dealing with meteorological measuring  
and weather forecasting.

TEXT DATA

Coverage: The book consists of a preface, an introduction, 11 chap-  
ters and 22 appendices. The introduction is a brief historical  
review describing the development of meteorology in Russia and  
giving an outline of the work performed by meteorological stations  
at present. The book deals with instruments used for the measuring  
of temperature, air moisture, evaporation, precipitation, clouds,  
solar radiations, pressure, wind elements, atmospheric electricity,

Title             : Action of some pharmacological agents on intracranial blood circulation

Periodical        : Fiziol. zhur. 40, 280-288, May/Jun 1954

Abstract          : Experiments on 27 cats disclosed that intracranial arteries are in constant state of contraction and that carbon dioxide is the most powerful agent in reducing the tone of these arteries. Nitrates, dibazol, and caffeine reduce the tonus of intracranial arteries by their direct action. Nicotinic acid (Vitamin PP) and citrin produce no noticeable effect on the tonus of intracranial arteries; citral (derivative of vitamin A) reduces their tonus only mildly. Diagrams. AUTHOR: Kedrov, A. I. *Card Tech Sci*

TITLE: The Effect of Certain Technological Defects in the Making of Welded Joints on Their Vibrational Strength (Vliyanje nekotorykh tekhnologicheskikh nedostatkov izgotovleniya svarnykh soyedineniy na ikh vibratsionnyu prochnost' )

PERIODICAL: Tr. Vses. n.-i. in-ta transp. str-va, 1956, Nr 20, pp 163-202

ABSTRACT: The effect of certain defects of welded joints on their strength is established, toward the end that the greatest permissible qualitative deviations of welded joints from standard requirements be determined. Welded low-carbon-steel samples, 10 to 24 mm. thick, with butt joints, exhibiting varying quality of workmanship, were tested under variable loads.

Especial attention was directed to the effects of external and internal pores, and also, of heterogeneous inclusions, on the fatigue strength of welded joints.

Card 1/2

124-11-13500

The Effect of Certain Technological Defects in the Making of Welded Joints on Their Vibrational Strength (Continued)

It is shown that the fatigue strength of butt joints does not depend on the presence of single or multiple, separately located pores, but that it depends greatly on the porosity accompanying blow-holes and inclusions. The presence of pores in connecting welds as such may also lower the fatigue strength. It is necessary, in their evaluation, that not only the depth of the defects, but also their location and arrangement on the welds be considered.

Samples with minor technological defects may exhibit even a greater fatigue strength than that of unfinished butt joints and other modes of connection entailing structural stress concentrations.

(G. A. Nikolayev)

SOV/124-58-5-6100

Translation from: Referativnyy zhurnal, Mekhanika, 1958, Nr 5, p 154 (USSR)

AUTHOR: Kedrov, A.I.

TITLE: The Effect of Some Technological Deficiencies in Manufacture on the Strength of Welded Assemblies (Vliyaniye nekotorykh tekhnologicheskikh nedostatkov izgotovleniya svarnykh soyedineniy na ikh prochnost')

PERIODICAL: Tr. Vses. n.-i. in-ta transp. str-va, 1957, Nr 24, pp 195-286

ABSTRACT: Tests carried out on welded components with butt seams without stress relief (normalizing) have shown that the presence of pores in the seams (with the exception of single exceedingly large pores or groups of pores) has no appreciable effect on the life of the welded assemblies. Tests carried out on butt welds with stress relief yielded different results. Presence of pores in the form of single large pores or chains of such pores resulted in an appreciable decrease in the service life of a welded assembly. In welded butt seams with slag inclusions the formation of an initial crack in a number of cases did not substantially lower the performance of the joints,

Card 1/2

SOV/124-58-5-6100

The Effect of Some Technological Deficiencies (cont.)

which withstood successfully large additional loads. Slag inclusions that appeared on the surfaces decreased the life of the welded joint to a greater degree than similar inclusions that remained in the weld. Failure at room temperatures was plastic in character while at low temperatures it exhibited brittle characteristics. Presence of pores or preliminary residual stresses did not cause any appreciable effect on the conditions of failure under static loads. Pores located on the surface were the most pronounced stress concentrators and caused a considerable scatter in the length of life of the weld. Static-load experiments on components with chordwise seams containing defects yielded satisfactory results as regards the yield strength and ultimate strength when tested at room and at 50°C temperatures.

development of radioactive methods used in prospecting, surveying, and mining of ores. Individual reports present the results of the latest scientific research on the development and improvement of the theory, methodology, and technology of radiometric investigations. Application of radioactive methods in the field of engineering geology, hydrology, and the control of ore enrichment processes is analyzed. No personalities are mentioned. There are no references.

AUTHOR: Kulekolov, N. M. (Doctor of technical sciences); Vedrov, A. I. (Doctor of technical sciences)

TITLE: Studies of hot-rolled converter steel as reinforcing metal

SOURCE: Beton i zhelezobeton, no. 12, 1964, 549-555

KEYWORDS: steel, fabricated structural metal, general construction

The use of converter steel as reinforcing metal in concrete structures is not new. It is known that the mechanical properties of converter steel differ from open-hearth steel. Both of these steels, for a temperature range of +20°C to -50°C, have shown satisfactory strength and plasticity; it is true, however, that for the upper level of content of the basic components (C, Mn, Si), steel KCh 5

Card 1/2

14-00000

ACCESSION NR: AP5018127

falls below state requirements for plasticity.

The authors recommend the use of small-diameter, hot-rolled steel as  
component in bridge structures, but with certain limitations in

residual stresses. The article includes some test techniques.

Orig. art. has 1 figure, 1 table, and 1 appendix.

10

Influence of reaction conditions on the yields of isom-  
 erides in nitration of acetanilide. A. P. Terent'ev  
 and H. M. Kedrov., *Sci. Repts. Moscow State Univ.* 1936,  
 No. 6, 213-24.---The content of *m*-NO<sub>2</sub>C<sub>6</sub>H<sub>4</sub>NH<sub>2</sub> (I) in the  
 product of nitration of NHPhAc rises from 6.7% when  
 100% H<sub>2</sub>SO<sub>4</sub> is used, to 28% with 84% H<sub>2</sub>SO<sub>4</sub>; nitration  
 does not proceed when the H<sub>2</sub>SO<sub>4</sub> contains more than  
 16% of H<sub>2</sub>O, while the use of 10% oleum leads to produc-  
 tion of tarry products. Increasing the amt. of 100%  
 H<sub>2</sub>SO<sub>4</sub> taken per g. of NHPhAc from 2 to 5 ml. greatly  
 lowers the yield of I, but further addn. of H<sub>2</sub>SO<sub>4</sub> does not  
 further reduce it. The yield of I is slightly increased by  
 raising the nitration temp. from -3° to 10°, while further  
 rise to 40° has no effect. The *m*-NO<sub>2</sub>C<sub>6</sub>H<sub>4</sub>NH<sub>2</sub> content  
 of the product is independent of temp., concn. and amt  
 of H<sub>2</sub>SO<sub>4</sub> taken. Addn. of AcOH or HgSO<sub>4</sub> does not  
 affect the relative yields of I and *p*-NO<sub>2</sub>C<sub>6</sub>H<sub>4</sub>NH<sub>2</sub>.

Formula for determining the viscosity of latex. H. M. Keddy, *Gumchouc and Rubber* (U. S. S. R.) 1938, No. 7, 29-31. The formula for detg. the viscosity of latex, given by Jordan, Brax and Roe (cf. C. A. 31, 5014'), viz.,

$$\eta' = K_1 \frac{[d_{10}(w_2 P_1 - w_1 P_2) + d_1(w_2 h_1 - w_1 h_2)]}{w_1 w_2} \times \frac{t_1 t_2}{(t_2 - t_1)} d_1$$

is wrong. For the ordinary case, when different units of latex are detd. for the same period of time ( $t_1 = t_2$ ),  $\eta'$  equals  $\infty$ . The correct formula is:

$$\eta' = K_1 \frac{(h_1 d_1 + P_1 d_{10}) - (h_2 d_2 + P_2 d_{10})}{w_1 d_1 - w_2 d_2} \times t_1 d_1$$

If  $t_1 = t_2$ , this formula becomes:

$$\eta'_{\infty} = K_1 \frac{(h_1 d_1 + P_1 d_{10}) - (h_2 d_2 + P_2 d_{10})}{(w_1 - w_2)} \times t_1 d_1$$

Limits and criteria of Poiseuille's law applied to latex. B. M. Kedrov. *Caoutchouc and Rubber* (U.S.S.R.) 1950, 42-1. Curves and math. equations, based on expts. with synthetic latex, show that the coeff. of viscosity of latex depends on the pressure, and on the radius of the capillary tube for plastic, viscous and turbulent flow. The limiting points for viscous flow of synthetic latex were defined and Poiseuille's law is shown to apply. **Hydrodynamic laws and relative viscosities of latex.** *Ibid.* 41-8. K. distinguishes 3 regions of flow, 1)  $\nu$ , region of viscous flow where  $R\eta$  is const. ( $R$  is the radius of the capillary tube,  $t$  the time of flow) and Poiseuille's law applies; region of nonviscous or turbulent flow where  $R\eta$  is const. and the Bernoulli theorem applies, and Reynold's region where both laws apply. The relative viscosities of 20% and 40% natural latex are compared with the viscosity of water and glycerol. **The limiting coefficient of relative viscosities of latex.** *Ibid.* 49. K. combines 2 equations

$$\text{for latex } \eta = Ad_1 \frac{(h_1 - h_2)}{l} \times t h_1 (h_1 - h_2) \text{ and for a standard liquid } \eta_0 = Ad_2 \frac{(h_1 - h_2)}{l} \times t_1 h_1 (h_1 - h_2)$$

for a burst type of app., with the restriction that  $h_1 = 2h_2$ , and obtains for the relative viscosity  $\eta/\eta_0$  the equation:

$\eta/\eta_0 = d_1/d_2 \times t/t_1 \times (h_1 - h_2)/(h_1 - h_2)$  For an app. with additional pressure  $P_0$  *Ibid.* 47.  $\eta/\eta_0 = d_1/d_2 \times t/t_1 \times (h_1 - h_2)/(h_1 - h_2)$  with the restriction that  $P_0 = 2P_1$  the equation  $\eta/\eta_0 = d_1/d_2 \times t/t_1 \times (h_1 - h_2)/(h_1 - h_2)$  is derived, where  $h_1$  is height of liquid column under pressure of a liquid column of height  $h_2$ ,  $d_1$  and  $d_2$  are the dia. of latex and standard liquid,  $t_1$  and  $t_2$  are the times of latex flowing in time  $t$  under pressures  $P_1$  and  $P_2$ . All other capital letters have same meaning as small letters apply to standard liquid.

 Mistakes Committed. (Seriosnije oshipki i upushtenia, Russian).  
 PERIODICAL: Vestnik Akademii Nauk SSSR, 1957, Vol 27, Nr 1, pp 122-122 (U.S.S.R.)  
 Received: 5 / 1957 Reviewed: 6 / 1957

ABSTRACT: On the Complete Works by D.I.MENDELEEF (1934-1954). This edition was not properly planned at all. Thus it was possible that in one single volume three different scientific fields were dealt with, which originally should have been dealt with by three separate volumes. This lack of planning produced unfavorable effects on the interior structure of the volumes. There are no prefaces to volumes 1 - 6 for they are all concentrated in volume 10. This planlessness gave rise to chaos, particularly as in some volumes whole pages are devoted to scientific problems belonging to other fields. MENDELEEF himself would have described much of what was included in this edition as mere compilation. From the point of view of a critic it must be said that only that ought to be included in a collection of the complete works of an author what has been recognized as scientific work by the author himself, and what had already been published or had been prepared for publication by the author himself. As it is, even series of articles were included in this edition which had not been written by MENDELEEF at all.

PA - 2487

Critical Notes and Bibliography. - Mistakes Committed.

The following must further be said in connection with deciphering MENDELEEF'S handwriting: The editors either were not able or did not take the trouble to study MENDELEEF'S handwriting, and some abbreviations he used when dealing with some chemical problems were misunderstood and what was actually printed was sheer nonsense. Thus, abbreviations "Okt.S" and "Marsch", which stood for "octahedral" and "Marschan" (R.F.Marschan) respectively, were translated as "October" and "March" !

It happened that the numbers of chapters were confused with numbers of elements etc.

Furthermore, there is a great number of printing errors.

PURPOSE: This book is intended for natural scientists and philosophers  
 who are interested in coordinating Communist philosophy with science.  
 CONTENTS: This is a publication of the transactions of the All-Union  
 Conference on Philosophic Problems of Natural Science which took  
 place in Moscow, October 21-25, 1959. The Conference was  
 attended by 20 academicians and 30 corresponding members of the  
 Academy of Sciences USSR, 15 academicians and 34 members of re-  
 public and special academies, 166 university and college workers,  
 240 workers of scientific research institutes, and 15 party the-  
 officials. The purpose of the Conference, as approved by the  
 Chairman of the Organizational Committee, V.I. Lenin, was  
 to unite the efforts of the philosophers and scientists in  
 the dialectical-materialistic interpretation of the achievements  
 of modern science, and to provide the philosophical background  
 required for the study of modern scientific problems.
